

# Social Security Finances: Findings of the 2009 Trustees Report

By *Joni Lavery*

## Summary

In January 2009, 51.1 million people, or about one in every six U.S. residents, received Social Security benefits. The benefits are financed by dedicated taxes on earnings paid by workers and employers, by income taxes that upper income beneficiaries pay on part of their Social Security benefits, and by interest earned on accumulated trust fund reserves. According to the 2009 Trustees report, the Social Security trust funds will have an annual surplus of \$137 billion in 2009. Annual surpluses are projected to continue for the next 14 years and reserves are projected to grow to \$4,332 billion by the end of 2023. Beginning in 2016, tax revenues flowing into the trust funds will be less than total expenditures. In 2037, the reserves are projected to be depleted. At that time, tax income coming into the trust funds will cover about 76 percent of benefits due, according to the 2009 report of the Social Security Trustees.

### What is the Trustees report?

The Social Security Act calls for a Board of Trustees for the Social Security trust funds and requires the Board to report annually to the Congress on the financial and actuarial status of the funds. The Board also reports on the Medicare trust funds, which are discussed in a separate report.

The Board has six members; the Secretaries of the Treasury; of Labor; and of Health and Human Services; the Commissioner of Social Security; and two trustees representing the public who are from different political parties and are appointed by the President and subject to Senate confirmation. The two public positions have been vacant for the past two years.

The report is a tool for Congress and the public to gauge the financial status of the Social Security system and to understand the size of the program's long-term commitments. The 2009 report is the 69<sup>th</sup> to be issued and is available on the website of the Office of the Chief Actuary of Social Security at [www.ssa.gov/OACT](http://www.ssa.gov/OACT).

**Joni Lavery** is Income Security Research Associate at the National Academy of Social Insurance.

## Who pays for Social Security?

Social Security is financed mainly by Social Security taxes paid by workers and employers. The tax rate for both workers and employers is 6.2 percent of earnings up to a cap (\$106,800 in 2009). The combined tax rate is 12.4 percent. Self-employed persons pay both the employee and the employer share of the tax and get a deduction from their personal taxable income for half of the total tax. In addition, upper income Social Security beneficiaries pay income taxes on part of their Social Security benefits, and some of this income-tax revenue is dedicated to the Social Security trust funds. Finally, interest earned on accumulated trust fund reserves is a third source of income. According to the 2009 Trustees report, income from Social Security payroll taxes will account for 82.7 percent of trust fund income in 2009, while income taxes paid by beneficiaries will be 2.9 percent, and interest on reserves will be 14.4 percent (Board of Trustees 2009).

## Who receives Social Security?

Social Security pays monthly benefits that replace, in part, income from wages lost when a worker retires, becomes disabled, or dies. Benefits are paid to the worker and to family members who relied on the lost earnings.

In January 2009, 51.1 million people, or about one out of every six Americans, received Social Security benefits (Social Security Administration (SSA) 2009a; U.S. Census Bureau 2009a). Nearly one family in four receives income from Social Security (U.S. Census Bureau 2009b).

Social Security beneficiaries include 32.5 million retired workers, 4.5 million widows and widowers, and 2.5 million spouses. About 7.4 million disabled workers received benefits, along with 0.9 million severely disabled adult children of deceased, retired, or disabled workers. Another 3.1 million children under age 18 received benefits because their parent died, became disabled, or retired (SSA 2009a).

## How much does Social Security pay?

The average monthly benefit paid to retired workers was \$1,155 (about \$14,000 annually) in January 2009 (SSA 2009b). The average benefit was somewhat smaller for disabled workers (\$1,063) and for widows and widowers age 60 or older (\$1,114). Benefits are somewhat higher for families. Widowed mothers with two children received \$2,379, on average, while disabled workers with a young spouse and one or more children received \$1,786 a month, on average (SSA 2009b). In contrast, the 2009 federal poverty guideline for a family of three is \$18,310 annually; the poverty guideline for a family of four is \$22,050 (U.S. Department of Health and Human Services 2009).

Social Security is the main source of income for most beneficiaries 65 years of age or older. The benefits account for half or more of total income for one out of two beneficiary married couples and 72 percent of nonmarried beneficiaries (SSA 2009c). For all but the highest-income 20 percent of older Americans, Social Security is the largest single source of income. For more information about the critical role Social Security plays in the lives of beneficiaries, see NASI's 2007 brief *Social Security and Retirement Income Adequacy* and the Academy's 2008 report *Social Security: An Essential Asset and Insurance Protection for All*.

**Table 1. Average Monthly Benefits Payable as of January 2009**

<b>Type of Beneficiary</b>	<b>Average Monthly Benefit</b>
Retired workers	\$1,155
Aged widows and widowers alone	\$1,114
Disabled worker alone	\$1,063
Widowed mother and two children	\$2,379
Disabled worker, young spouse and one or more children	\$1,786

### **How do actuaries project the future?**

Each year the Social Security actuaries review the performance of the economy, take into account new laws and regulations, and reassess assumptions about future economic and demographic trends that will affect the Social Security system – including employment, wage levels, productivity, inflation, interest rates, birth rates, death rates, and immigration.

The actuaries make projections for three scenarios: low-cost; high-cost; and intermediate. The trustees review and agree on assumptions for each scenario. The intermediate scenario is considered their “best estimate” and is most often cited. In general, the low-cost estimate uses a more optimistic set of assumptions (such as higher economic growth, lower unemployment, and low inflation) whereas the high-cost estimate employs more pessimistic assumptions as they pertain to the trust funds’ future financial outlook. For each scenario the Trustees report projects the status of the funds for the near term (the next 10 years) and the long term (the next 75 years).

### **What do the Trustees project for the near term?**

In 2009, the Social Security trust funds will receive income of \$819 billion and pay out \$682 billion, leaving an annual surplus of \$137 billion. Almost all outgo is used to pay benefits; less than 1 percent of outgo is spent on administrative costs.

By law, the annual surpluses – amounts not needed for current expenditures – are invested in interest-bearing U.S. government securities. The invested assets, or trust fund reserves, are estimated to be \$2,556 billion by the end of 2009.

Social Security benefits generally increase each year by an annual cost-of-living adjustment (COLA). This COLA is based on the Consumer Price Index (CPI-W). Because the CPI-W declined after the December 2008 COLA was determined, no COLA is expected at the end of 2009 and 2010. In addition, the law specifies that the contribution and benefit base (taxable maximum) not increase if no COLA is provided. Thus, the taxable maximum for 2010 and 2011 is expected to remain the same as for 2009.

Under the intermediate assumptions, the Social Security trust funds are projected to have surpluses in each of the next 10 years (2009-2018). That is, income from taxes and interest

will exceed outgo for benefits and administrative costs (Table 2). By the end of 2018, the reserves are estimated to be \$4,009 billion.

In fact, the Social Security trust funds are projected to have surpluses in each of the next 15 years (2009 – 2023), and the reserves will continue to grow. By the end of 2023, the reserves are estimated to be \$4,332 billion.

**Table 2: OASDI Trust Fund Operations, 2009-2018 (in billions)**

Calendar Year	Income			Outgo	Net change in reserves	Assets at year end
	Taxes	Interest	Total Income			
2009	\$701	\$118	\$819	\$682	\$137	\$2,556
2010	\$728	\$120	\$848	\$709	\$138	\$2,694
2011	\$764	\$126	\$890	\$735	\$155	\$2,849
2012	\$810	\$136	\$947	\$772	\$174	\$3,023
2013	\$855	\$148	\$1,004	\$823	\$181	\$3,204
2014	\$899	\$161	\$1,060	\$880	\$179	\$3,383
2015	\$944	\$172	\$1,116	\$941	\$175	\$3,558
2016	\$986	\$183	\$1,170	\$1,005	\$164	\$3,722
2017	\$1,031	\$194	\$1,226	\$1,074	\$151	\$3,874
2018	\$1,077	\$206	\$1,282	\$1,148	\$135	\$4,009

### What do the Trustees project for the next 75 years?

Under intermediate assumptions, income to the trust funds will not cover all scheduled benefits over the next 75 years. According to the 2009 Trustees report:

- In 2016, tax revenues flowing into the trust funds will be less than total expenditures for that year. Interest on the reserves and the assets themselves will be available to supplement tax revenues until 2023.
- In 2037, the reserves will be depleted. Income coming into the funds at that time is expected to cover about 76 percent of the scheduled benefits and administrative costs.
- By 2083, the end of the 75-year projection period, assuming no changes in taxes or benefits, tax income is projected to cover about 74 percent of costs.

The long-range actuarial deficit is 2.00 percent of taxable payroll. This means that to close this gap solely with a tax increase, the Social Security tax rate could be increased by 2.00 percentage points, starting this year. This change would raise the Social Security tax rate paid by employees (and matched by employers) by 1.00 percentage point, from 6.2 to 7.2 percent. The Trustees are not proposing a tax increase. This summary measure simply shows the size of the long-range deficit in relation to taxable earnings, which are the main source of income to the system. For more information on eliminating the funding shortfall see NASI's 2005 brief *Options to Balance Social Security Funds Over the Next 75 Years*.

The Trustees also project Social Security tax income and outgo in relation to the total economy, or gross domestic product (GDP). In 2008, Social Security tax revenue coming into the system was 4.9 percent of GDP, while outgo from the trust funds was 4.4 percent of GDP, leaving a surplus of about 0.5 percent of GDP. By 2031, tax income is projected

to be 4.8 percent of GDP while outgo is projected to rise to 6.1 percent of the total economy. By 2083, the end of the 75-year projection period, outgo will be slightly lower than projected for 2031, but tax income will have declined more as a share of GDP (Table 3).

**Table 3. Social Security Tax Income and Outgo  
as a Percent of Gross Domestic Product**

	Tax Income	Outgo
2008	4.9	4.4
2031	4.8	6.1
2083	4.4	5.9

### **Why will Social Security cost more in the future?**

Social Security will cost more in the future for two reasons: first, the large number of boomers born between 1946 and 1964 will start receiving Social Security (the oldest boomers will reach age 65 in 2011); and second, people are living longer after age 65. While costs are projected to rise, the tax rate is constant under current law.

### **Why is Social Security income projected to decline as a share of GDP?**

While Social Security taxes are a constant share of taxable payroll, those revenues are projected to decline as a share of the entire economy, or GDP, as shown in Table 3. This occurs because workers' wages that are subject to Social Security taxes will grow more slowly than other types of income, according to the projections. As a share of the total economy, wages that are subject to Social Security taxes equaled 38.5 percent of GDP in 2008. That share is projected to decline to 33.1 percent in 2083. Key sources of income that are not taxed to pay for Social Security include: workers' earnings above the tax base (\$106,800 in 2009); employers' contributions to workers' health insurance premiums, pensions, 401(k) plans, and other employee benefits; and income from property, such as interest, dividends, and rental income.

### **How do the 2009 "best estimate" projections compare to previous years' reports?**

Table 4 compares some key results from the current and previous Trustees reports. The projections change due to several factors including changes in methods and assumptions and shifts in the 75-year projection period.

### **What do the low-cost and high-cost projections show?**

Under the high-cost scenario, the Social Security trust fund reserves would be depleted in 2029 instead of 2037. Under the low-cost scenario, Social Security is solvent through the 75-year projection period. The difference among estimates reflects the great uncertainty about what will happen in the future.

### **Where does the Social Security surplus go?**

By law, Social Security's surplus funds are invested in interest bearing securities backed by the full faith and credit of the U.S. government. Currently all trust fund assets are invested in special issue securities, largely U.S. Treasury bonds. These securities earn interest that is credited to the trust funds. The securities can be redeemed whenever needed to pay Social

Security costs. In financial markets, Treasury securities (bills, notes and bonds) are considered a very safe investment because they are backed by the full faith and credit of the United States government.

**Table 4. Comparison of Projections in Trustees Reports 1993-2009**

Year of Trustees Report	Year when outgo exceeds current tax revenue	Year when trust fund reserves become fully drawn-down	Long-range actuarial deficit (expressed as a percent of taxable payroll)
1993	2025	2036	1.46
1994	2018	2029	2.13
1995	2013	2030	2.17
1996	2012	2029	2.19
1997	2012	2029	2.23
1998	2013	2032	2.19
1999	2014	2034	2.07
2000	2015	2037	1.89
2001	2016	2038	1.86
2002	2017	2041	1.87
2003	2018	2042	1.92
2004	2018	2042	1.89
2005	2017	2041	1.92
2006	2017	2040	2.02
2007	2017	2041	1.95
2008	2017	2041	1.70
2009	2016	2037	2.00

The sum of all Treasury securities makes up the national debt. Most of the debt is held by (or owed to) the public – that is, individuals, corporations, and other investors in the United States and abroad who have loaned money to the government by investing in government securities. At the end of 2008, 24 percent of the national debt was owed to the Social Security trust funds; another 19 percent was held by other federal trust funds or accounts (U.S. Treasury 2009a; Tables FD-1 and 3).

Interest on the national debt is a legal obligation of the federal government. At the end of fiscal year 2008, total interest on the debt was \$451 billion (U.S. Treasury 2009b). Some people worry when they hear that Social Security annual cash surpluses are loaned to the U.S. Treasury and the government spends the cash on other activities. This is not a misuse of Social Security funds. Regardless of how the government uses the cash, the Treasury securities held by the trust funds are a binding legal commitment for the Treasury to redeem the securities with interest when the money is needed to pay Social Security benefits.

The Social Security surplus helps lower the debt owed to the public. When the rest of the government budget is in deficit, a Social Security annual cash surplus reduces the amount that the government would otherwise have to borrow from the public and in that way slows the growth in the debt held by the public. When the rest of the government budget is balanced or in surplus, a Social Security annual cash surplus results in a reduction of the debt owed to the public. In either case, slowing the growth of (or actually reducing) the debt owed to the public will make it easier to afford Social Security and other activities of government in the future.
